

FIXME - the name of your project

Final Report for CS39440 Major Project

Author: FIXME (FIXME@aber.ac.uk)

Supervisor: Dr./Prof. My Supervisor (FIXME@aber.ac.uk)

6th March 2012

Version: 1.0 (Draft)

This report was submitted as partial fulfilment of a BSc degree in
Computer Science (G400)

Department of Computer Science
Aberystwyth University
Aberystwyth
Ceredigion
SY23 3DB
Wales, UK

Declaration of originality

In signing below, I confirm that:

- This submission is my own work, except where clearly indicated.
- I understand that there are severe penalties for plagiarism and other unfair practice, which can lead to loss of marks or even the withholding of a degree.
- I have read the sections on unfair practice in the Students' Examinations Handbook and the relevant sections of the current Student Handbook of the Department of Computer Science.
- I understand and agree to abide by the University's regulations governing these issues.

Abstract

Include an abstract for your project. This should be no more than 300 words.

CONTENTS

1	Background & Objectives	1
1.1	Background	1
1.2	Analysis	1
1.3	Process	2
2	Design	3
2.1	Overall Architecture	4
2.2	Some detailed design	4
2.2.1	Even more detail	4
2.3	User Interface	4
2.4	Other relevant sections	4
3	Implementation	5
4	Testing	6
4.1	Overall Approach to Testing	6
4.2	Automated Testing	6
4.2.1	Unit Tests	6
4.2.2	User Interface Testing	6
4.2.3	Stress Testing	6
4.2.4	Other types of testing	6
4.3	Integration Testing	6
4.4	User Testing	6
5	Evaluation	7
	Appendices	8
A	Third-Party Code and Libraries	9
B	Code samples	10
2.1	Random Number Generator	10

LIST OF TABLES

Chapter 1

Background & Objectives

This section should discuss your preparation for the project, including background reading, your analysis of the problem and the process or method you have followed to help structure your work. It is likely that you will reuse part of your outline project specification, but at this point in the project you should have more to talk about.

Note:

- All of the sections and text in this example are for illustration purposes. The main Chapters are a good starting point, but the content and actual sections that you include are likely to be different.
- Look at the document on the Structure of the Final Report for additional guidance.

1.1 Background

What was your background preparation for the project? What similar systems did you assess? What was your motivation and interest in this project?

1.2 Analysis

Taking into account the problem and what you learned from the background work, what was your analysis of the problem? How did your analysis help to decompose the problem into the main tasks that you would undertake? Were there alternative approaches? Why did you choose one approach compared to the alternatives?

There should be a clear statement of the objectives of the work, which you will evaluate at the end of the work.

In most cases, the agreed objectives or requirements will be the result of a compromise between what would ideally have been produced and what was felt to be possible in the time available. A discussion of the process of arriving at the final list is usually appropriate.

1.3 Process

You need to describe briefly the life cycle model or research method that you used. You do not need to write about all of the different process models that you are aware of. Focus on the process model that you have used. It is possible that you needed to adapt an existing process model to suit your project; clearly identify what you used and how you adapted it for your needs.

Chapter 2

Design

You should concentrate on the more important aspects of the design. It is essential that an overview is presented before going into detail. As well as describing the design adopted it must also explain what other designs were considered and why they were rejected.

The design should describe what you expected to do, and might also explain areas that you had to revise after some investigation.

Typically, for an object-oriented design, the discussion will focus on the choice of objects and classes and the allocation of methods to classes. The use made of reusable components should be described and their source referenced. Particularly important decisions concerning data structures usually affect the architecture of a system and so should be described here.

How much material you include on detailed design and implementation will depend very much on the nature of the project. It should not be padded out. Think about the significant aspects of your system. For example, describe the design of the user interface if it is a critical aspect of your system, or provide detail about methods and data structures that are not trivial. Do not spend time on long lists of trivial items and repetitive descriptions. If in doubt about what is appropriate, speak to your supervisor.

You should also identify any support tools that you used. You should discuss your choice of implementation tools - programming language, compilers, database management system, program development environment, etc.

Some example sub-sections may be as follows, but the specific sections are for you to define.

2.1 Overall Architecture

2.2 Some detailed design

2.2.1 Even more detail

2.3 User Interface

2.4 Other relevant sections

Chapter 3

Implementation

The implementation should look at any issues you encountered as you tried to implement your design. During the work, you might have found that elements of your design were unnecessary or overly complex; perhaps third party libraries were available that simplified some of the functions that you intended to implement. If things were easier in some areas, then how did you adapt your project to take account of your findings?

It is more likely that things were more complex than you first thought. In particular, were there any problems or difficulties that you found during implementation that you had to address? Did such problems simply delay you or were they more significant?

You can conclude this section by reviewing the end of the implementation stage against the planned requirements.

Chapter 4

Testing

Detailed descriptions of every test case are definitely not what is required here. What is important is to show that you adopted a sensible strategy that was, in principle, capable of testing the system adequately even if you did not have the time to test the system fully.

Have you tested your system on real users? For example, if your system is supposed to solve a problem for a business, then it would be appropriate to present your approach to involve the users in the testing process and to record the results that you obtained. Depending on the level of detail, it is likely that you would put any detailed results in an appendix.

The following sections indicate some areas you might include. Other sections may be more appropriate to your project.

4.1 Overall Approach to Testing

4.2 Automated Testing

4.2.1 Unit Tests

4.2.2 User Interface Testing

4.2.3 Stress Testing

4.2.4 Other types of testing

4.3 Integration Testing

4.4 User Testing

Chapter 5

Evaluation

Examiners expect to find in your dissertation a section addressing such questions as:

- Were the requirements correctly identified?
- Were the design decisions correct?
- Could a more suitable set of tools have been chosen?
- How well did the software meet the needs of those who were expecting to use it?
- How well were any other project aims achieved?
- If you were starting again, what would you do differently?

Such material is regarded as an important part of the dissertation; it should demonstrate that you are capable not only of carrying out a piece of work but also of thinking critically about how you did it and how you might have done it better. This is seen as an important part of an honours degree.

There will be good things and room for improvement with any project. As you write this section, identify and discuss the parts of the work that went well and also consider ways in which the work could be improved.

Review the discussion on the Evaluation section from the lectures. A recording is available on Blackboard.

Appendices

Appendix A

Third-Party Code and Libraries

If you have made use of any third party code or software libraries, i.e. any code that you have not designed and written yourself, then you must include this appendix.

As has been said in lectures, it is acceptable and likely that you will make use of third-party code and software libraries. The key requirement is that we understand what is your original work and what work is based on that of other people.

Therefore, you need to clearly state what you have used and where the original material can be found. Also, if you have made any changes to the original versions, you must explain what you have changed.

As an example, you might include a definition such as:

Apache POI library The project has been used to read and write Microsoft Excel files (XLS) as part of the interaction with the clients existing system for processing data. Version 3.10-FINAL was used. The library is open source and it is available from the Apache Software Foundation [?]. The library is released using the Apache License [?]. This library was used without modification.

Appendix B

Code samples

2.1 Random Number Generator

The Bayes Durham Shuffle ensures that the psuedo random numbers used in the simulation are further shuffled, ensuring minimal correlation between subsequent random outputs [?].

1.3 - Release

2.2 Functionality

The major aim for this project is to provide an android alternative to the already existing Access Aber web application. Currently the project exists solely as a web application which can be run on both iOS and Android through the use of a web browser. However the project is limited due to the time it was developed in and it is my aim to show that developing the application native to one environment can provide benefits which make the time and effort worth it. The idea is to not only port over the existing application but to improve upon it in ways that are seen fit. I feel that with the power given to a programmer within not just android, but mobile devices in general, the application can be made to be not only effective but intuitive and an asset to those who visit campus. The application will consist of several areas that will benefit the user and will heavily rely on the Google Maps Android API.

2.2.1 Route Finding

One of the main features to be included is that of a route finding system around campus. This differs from the web application due to the system actually finding a route, as it stands the application has around 200 stored routes which a user can select from. However they are shown as a list and require the user to spend a large time searching through with no guarantee of there route actually being stored.

The android application will be developed in a different way. The user must be able to find there way around campus without having to search through 200 routes. The plan to combat this is to first have a much simpler way of route selection, ideally this will be two drop down boxes where a user selects where they are and where they want to go. This means that if we cover 20 locations, we just need 20 options instead of representing it as over 400 hard coded routes which is what would be needed in the current set up.

The second plan to combat the current issue is to remove most hard coded routes. All that ideally has to be implemented is for each building to connect to at least one other. If this is implemented correctly we can instead search for a Route rather than store them. This saves the user time and means that the application should be easily extendible. One issue which arose in a meeting with the section of the University which initially set up the project was that while routes were shown not much else was. No information regarding the route and no indication of the difficulty of it, both of these would be of a lot of use especially to disabled users of the application. It is already known that colour coded routes should be possible within the application, combining this with a small window which shows information such as distance,elevation and steps on the route should fix this problem which has been highlighted.
